> hello_judges · meet_u_guardian

u—guardian

Your wallet shows what you own. U-Guardian explains what matters.

An AI companion that explains your crypto wallet, investigates relevant changes, and speaks up when a watch you chose is triggered.

Team TuiDui | AI agent orchestration | Web3 data | Voice experience

BUILT WITH

u-topia U-bot | Avalanche | Tokenomist | ElevenLabs

U-Hackathon 2026 Track 1: AI

Bangkok 13:15:29

02 Problem

> a_balance_is_not_an_answer

A balance is not an answer.

A wallet can show **how much** you hold. It rarely explains **what changed, why it matters to your goal, or what to watch next**.

A new user may have to piece together wallet activity, token supply, market context, and news across several products.

This matters when the same money is intended for a future expense, savings, or everyday use.

13% of cryptoasset users thought they would have financial protection when purchasing cryptoassets.

9% said they used a credit card or existing credit facility to obtain cryptoassets.

Evidence: FCA 2025 UK survey. UK survey findings, **not** measured behavior of U-topia users.

> one_companion_three_jobs

One companion, three jobs.

PILLAR	WHAT THE USER ASKS	WHAT GUARDIAN DOES
Wallet health	*“Is my wallet too concentrated for a six-month goal?”*	Reads the public Avalanche wallet and explains holdings, coverage, and concentration in the context of a saved goal.
What changed & monitor	*“What changed?” / “Alert me if AVAX drops 10%.”*	Compares the latest observations with a prior briefing; drafts a specific watch for user confirmation.
Advice with real information	*“What is AVAX, and what should I watch out for?”*	Uses retrieved project, market, tokenomics, and available headline evidence to explain trade-offs and uncertainty.

Product idea: the mascot is the agent interface. Text, voice, status animations, sources, and watch confirmations are all in one conversation.

From a question to a useful alert.

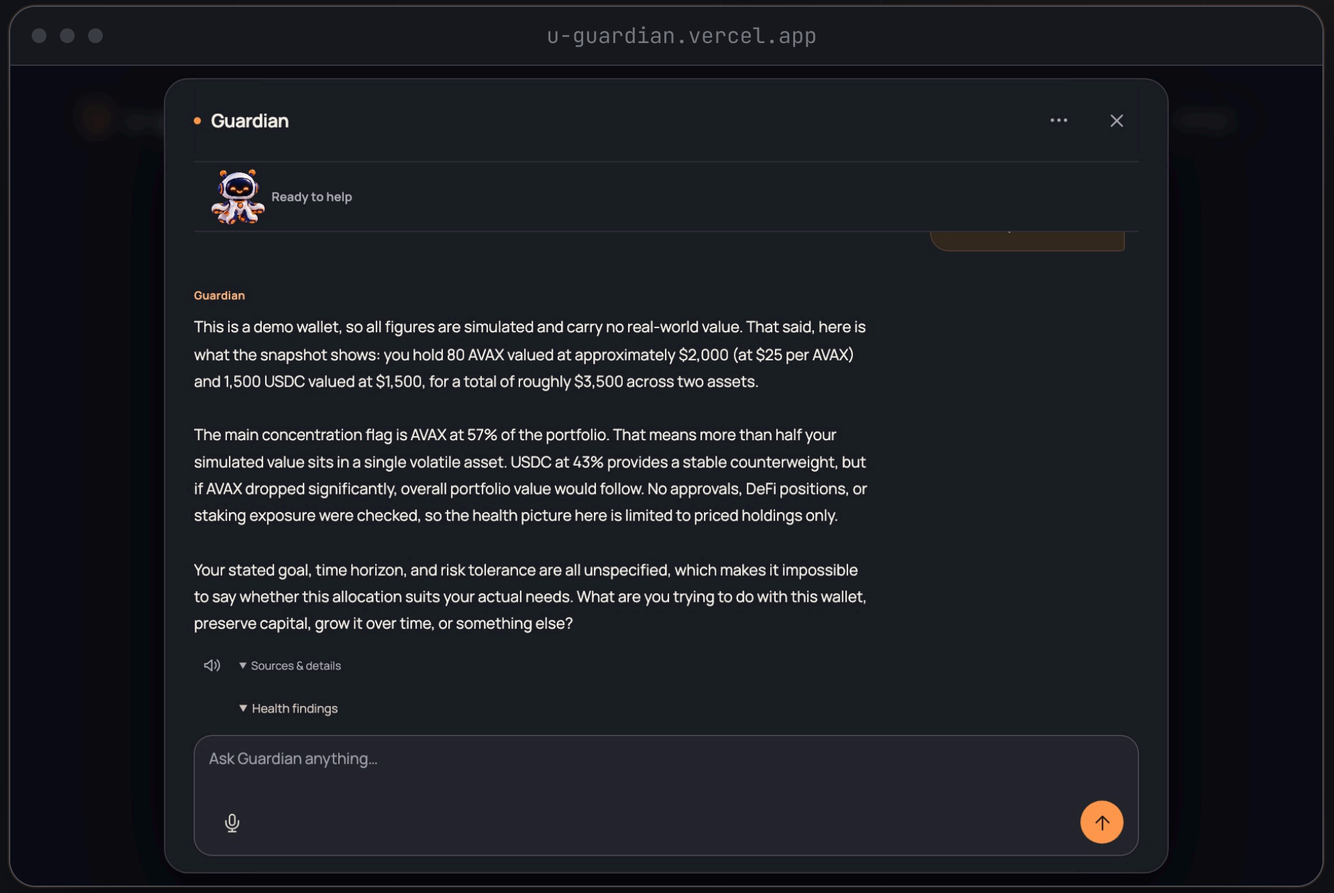

01 Open the single-page wallet; click the mascot. Ask **“Check my wallet health.”** Show the answer and **Sources & details**.

02 Ask **“Alert me when AVAX price drops 10% from the price when I confirm.”** Review the exact threshold and **Confirm watch**.

03 In **Demo** wallet mode, simulate **AVAX price −12%**. Show the **simulated in-app call**; answer it and let ElevenLabs read the alert.

04 Ask **“What changed since my last briefing?”** Show how the agent investigates. Open **Debug** briefly to reveal the tool path.

Judges should notice: the mascot changes between idle, thinking, search and answer as the agent works. Plain-language answer plus its evidence. Backup clip: 30–60 s, same demo wallet and confirmed watch. Price movement is **synthetic** and labelled “Demo data”.

HIGH-LEVEL OVERVIEW

U-Guardian at a glance: one conversation, named tools.

● REAL API PULL

Agent decisions backed by named tools.

User text / voice → **ElevenLabs speech-to-text**

↓

U-bot Professional: choose a validated tool → read result → explain

↓

Avalanche

#97,678,805

Wallet / transfer

1,345,656 AVAX in the sampled public wallet

Tokenomist

651

Supply / token

tokens in catalog · AVAX circulating 443.6M

CoinGecko + RSS

$10.08

Market / project / news

AVAX +4.87% 24h · mcap $4.47B

↓

Evidence + watch proposal → **user confirmation** → alert + ElevenLabs voice

BUILT WITH

Node.js backend; a single-page JavaScript web UI; Vercel and private session storage for the hosted MVP. The server validates U-bot's JSON tool request against an allowlist and executes the selected function. The model does **not** run arbitrary generated code.

WHY THIS MATTERS

Wallet data personalizes the answer. Tokenomist adds supply and project evidence. Public market and news sources fill gaps the sponsor APIs do not cover. ElevenLabs makes the agent accessible by voice. Debug shows each tool choice, result, and failure.

> inside_an_existing_app

Make crypto easier to understand inside an existing app.

VALUE TO USERS

Fewer tabs to interpret a wallet; clearer risk context tied to a personal goal; user-chosen alerts with an explanation of what triggered them.

VALUE TO A PLATFORM

A companion that can sit beside an existing wallet experience and make its data more useful without asking the platform to replace its wallet.

PROPOSED MODEL · HYPOTHESIS

B2B licensing / white-label companion for wallet and financial apps, with a platform fee and usage-based pricing for agent and voice calls. Not launched pricing.

PILOT MEASURES · TO MEASURE

Time to understand a wallet change; % of users who correctly understand an alert; watch activation and retention; source-detail views; voice use; provider cost per useful answer. Not claimed results.

> context_a_balance_screen_misses

Context that a balance screen misses.

INITIAL USERS

English- and Thai-speaking crypto holders who want plain-language help with a wallet, goals, and selected monitoring.

INITIAL BUYER HYPOTHESIS

Wallet, exchange, or consumer-finance platforms that already serve these users.

COMMON ALTERNATIVE	WHAT USERS STILL NEED TO DO	U-GUARDIAN MVP
Wallet balance / history view	Interpret events and their relevance themselves	Explains the observed wallet and compares it with a saved goal or briefing
General-purpose chatbot	Supply their own current wallet and token evidence	Retrieves named sources and keeps evidence inspectable
Separate alert service	Set a rule in a different interface	Drafts a watch conversationally and asks for confirmation

Market evidence, not TAM: FCA 2025 UK survey reports 8% adult ownership and 91% awareness. We would validate demand with an in-app pilot before estimating U-topia-specific adoption or revenue. fca.org.uk

> from_hackathon_mvp_to_in_app_companion

From hackathon MVP to in-app companion.

BUILT DURING THE HACKATHON

Working MVP

- ✓ Three working conversation pillars with validated U-bot tool calls, source details, Debug flow, and English/Thai UI.
- ✓ Avalanche wallet reading; Tokenomist tokenomics research; market and headline tools; ElevenLabs push-to-talk and spoken answers.
- ✓ Confirmed watch rules for wallet quantity, supply events, review dates, activation-price moves, and transfer-value thresholds; simulated in-app alerts.

NEXT 3 MONTHS

Pilot

- → Pilot inside a host app.
- → Improve the shared U-bot account connection.
- → Validate answer quality, alert comprehension, and provider cost.

NEXT 6 MONTHS

Always on

- → Background watch evaluation and real delivery channels.
- → Stronger wallet coverage and explicit freshness / coverage reporting.

NEXT 12 MONTHS

Platform

- → Reusable integration kit.
- → Production-grade consent and account controls.
- → Broader asset coverage and measured platform rollout.

> give_every_wallet_a_guide

Give every wallet a guide.

> **Crypto should come with context, not just a balance.**

Our ask: pilot U-Guardian as a companion inside U-topia's existing app, measure whether users understand their assets and alerts better, then build the integration together.

Q&A · try it live
